Bayesian Interaction Primitives:

A SLAM Approach to Human-Robot Interaction

Joseph Campbell, Heni Ben Amor
School of Computing, Informatics and Decision Systems Engineering
Arizona State University

1st Conference on Robot Learning (CoRL 2017)
Mountain View, California
November 13, 2017

Human-Robot Interaction

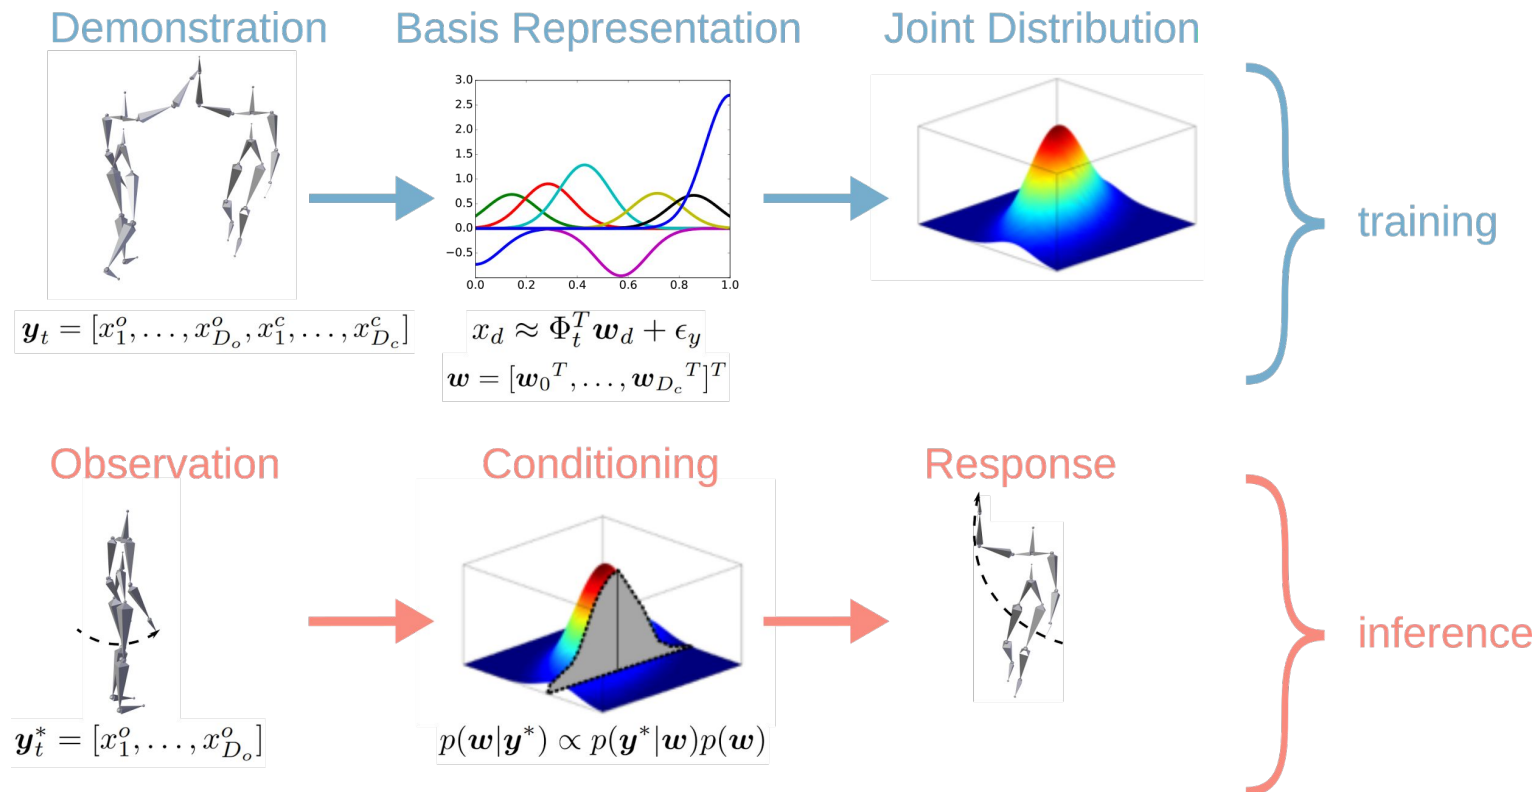

- Programming HRI is *hard!*
- Represent interaction in time & space
- Generalize over interaction partners

Robot Learning

- Learning from demonstration
- Multimodal/high-dimensional
- Robust in time & space

Interaction Primitives

Problem: Temporal Alignment

Dynamic Time Warp

- Poor performance in higher dimensions
- Not probabilistic
- Does not leverage spatial inference
- Difficult to use recursively

Simultaneous Localization and Mapping

Insight:

“Localize in **time**, generate action in **space**”

- Probabilistic reasoning over time
- Action generation in space
- Phase = location
- Weights = map

Bayesian Interaction Primitives

Extended Kalman Filter SLAM applied to Interaction Primitives

$$p(\delta_t, \dot{\delta}_t, w | y^*) \propto p(y^* | \delta_t, \dot{\delta}_t, w) p(\delta_t, \dot{\delta}_t, w)$$

$$s_t = [\delta_t, \dot{\delta}_t, w^T]^T$$

$$p(s_t | z_{1:t}) = \mathcal{N}(s_t | \mu_t, \Sigma_t)$$

$$\mu_t = g(u_t, \mu_{t-1}),$$

$$\Sigma_t = G_t \Sigma_{t-1} G_t^T + R_t,$$

$$K_t = \Sigma_t H_t^T (H_t \Sigma_t H_t^T + Q_t)^{-1},$$

$$\mu_t^+ = \mu_t + K_t (z_t - h(\mu_t)),$$

$$\Sigma_t^+ = (I - K_t H_t) \Sigma_t.$$

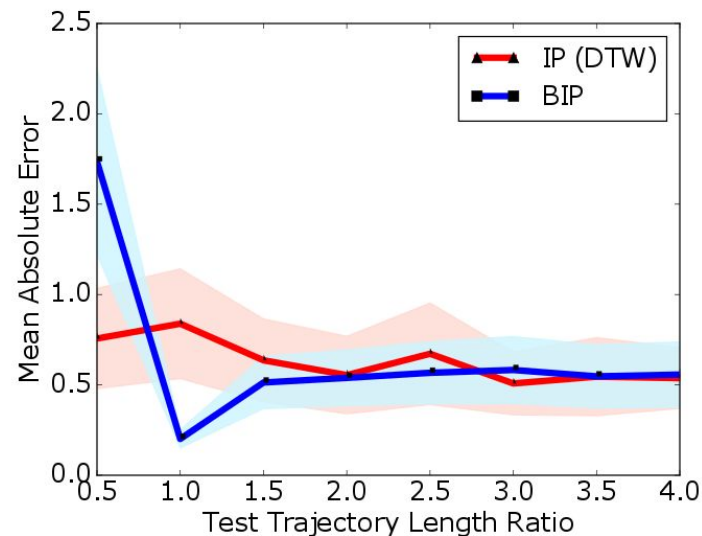

Experiments

Results

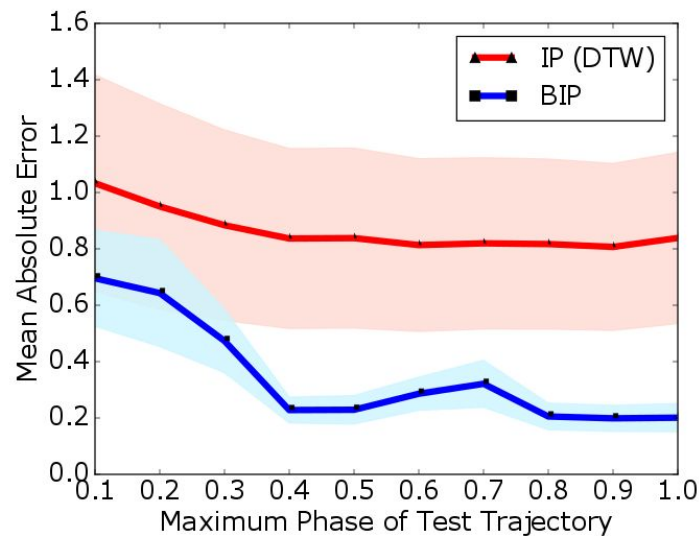

Spatial robustness

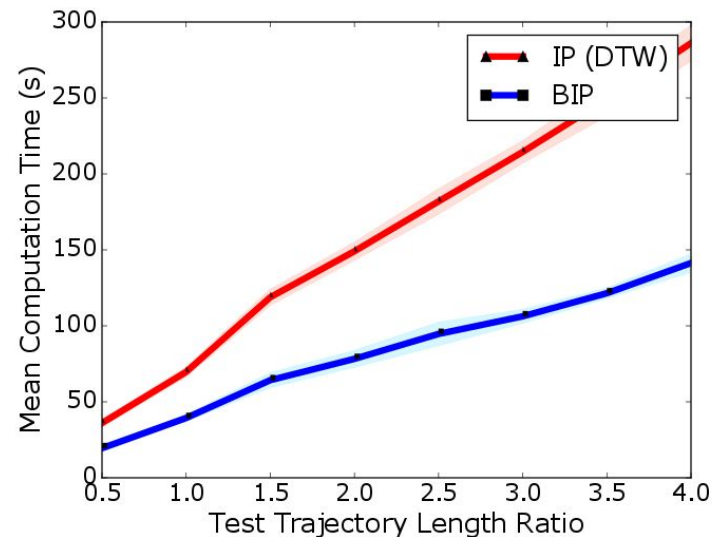

Temporal robustness

Partial visibility

Computational complexity

Applications

Conclusions

- Established **conceptual link** between **HRI** and **SLAM**
- **Bayesian Interaction Primitives** from demonstrations
- Properties:
 - Improved robustness to noise
 - Reduced computational complexity
 - Fully Bayesian inference in time and space
- Applied to multiple, physical human-robot collaboration tasks

Future work:

- Highly multimodal scenarios
- Noise-resilient SLAM algorithms
